

“A little about The U.S. money”

Hello, good afternoon everyone, for those of you who don't know me yet, my name is Samuel Áquila, and today, I'm going to talk about “A little about The U.S. money”, with the aim of gaining knowledge about it.

It all starts at the US Mint, where the country's circulating coins are produced. The Mint also produces coin-related products, including proof coins, which are coins with a better finish that have been minted at least twice; uncirculated and commemorative coins; Congressional Gold Medals; and precious metal coins. Money in the United States is divided into two categories, paper money and coins.

American paper money comes in seven denominations: \$1, \$2, \$5, \$10, \$20, \$50 and \$100. The United States no longer issues notes in larger denominations, such as \$500, \$1,000, \$5,000 and \$10,000 notes. But they remain legal tender and may still be in circulation.

As for coins, they have four denominations in circulation, the Penny, which is worth 1 cent, Nickel, which is worth 5 cents, Dime, which is worth 10 cents and Quarter, which is worth 25 cents. Half dollar and \$1 coins are produced as collectibles. Since 2012, dollar coins are circulating quality produced as collectibles, not for everyday transactions. However, they may still be ordered by the Federal Reserve for circulation and used as legal tender.

This was just an overview of US banknotes and coins, I hope you enjoyed it, thanks for your attention!
